Management of small-bowel polyps at double-balloon enteroscopy.

DNA methylation status of epithelial-mesenchymal transition (EMT)-related genes is associated with severe clinical phenotypes in ulcerative colitis (UC).
Tahara T, Shibata T, Okubo M, Ishizuka T, Nakamura M, Nagasaka M, Nakagawa Y, Ohmiya N, Arisawa T, Hirata I.

Classification of intestinal lymphangiectasia with protein-losing enteropathy: white villi type and non-white villi type.
Ohmiya N, Nakamura M, Yamamura T, Yamada K, Nagura A, Yoshimura T, Hirooka Y, Hirata I, Goto H.

Association between common genetic variants in pre-microRNAs and prognosis of advanced gastric cancer treated with chemotherapy.
Anticancer Res. 2014 Sep;34(9):5199-204.

Change in DNA methylation patterns of SLC6A4 gene in the gastric mucosa in functional dyspepsia.

Risk factors of symptomatic NSAID-induced small intestinal injury and diaphragm disease.

Cowden syndrome complicated by a gastrointestinal stromal tumor.

A case of plummer-vinson syndrome showing rapid improvement of Dysphagia and esophageal web after two weeks of iron therapy.
Effect of RANTES gene promoter genotypes in patients with ulcerative colitis.

Heat-shock protein 70-2 BB genotype is associated with reduced risks of the steroid-dependent and refractory phenotypes of ulcerative colitis.

Steroid-resistant Cronkhite-Canada syndrome successfully treated by cyclosporine and azathioprine.

Light blue crest and ridge/villous patterns in the uninvolved gastric antrum by magnifying NBI endoscopy correlate with serum pepsinogen and gastric cancer occurrence.
